	<b>Methodology</b>			
	Institutes and hospitals are ranked on the basis of their field-weighted citation impact, calculated using Elsevier's SciVal tool, between 2013 and 2017. Research organisations that produced fewer than 500 research papers during this period are excluded. Field-weighted citation impact is a normalised measure of citation impact where citations are normalised according to discipline, publication type (article, review, letter, etc) and age of publication, such that papers are only compared against others of the	same type in the same field and in the same publication year. Hence, although there are many medical research facilities in the ranking, this reflects their abundance, rather than the fact that medical research is typically more highly cited than research in many other fields. The global average is 1, so a field-weighted citation impact of 2 would indicate a citation impact that is double the world average. Institutes that are part of a network, such as Max Planck Society institutes, have been grouped together.
